Summary of Test Method**

The GM Oxidation and Deposit Test (GMOD) is a fired-engine, dynamometer lubricant test for evaluating automotive engine oils for certain high-temperature performance characteristics, including oil thickening, piston deposits, oil consumption, low-temperature performance, and the ability of an oil to retain Phosphorus. Such oils include both single viscosity grade and multi-viscosity grade oils that are used in spark-ignition, gasoline-fueled engines, as well as diesel engines. The GMOD Test utilizes a General Motors LSX, water-cooled, four cycle, V-8 engine as the test apparatus. The GMOD test engine is an overhead valve design (OHV) and uses a single camshaft operating both intake and exhaust valves via pushrods and hydraulic valve lifters. The engine uses a GM port fuel injection system. The test engine is overhauled prior to each test following the Engine Assembly/Disassembly Manual.

The GMOD Test consists of a ten-minute operational check, followed by 100 hours of engine operation at moderately high speed, load, and temperature conditions. The 100-hour segment is broken down into five 20-hour test segments. Following each 20-hour segment, and the ten-minute operational check, oil samples are drawn from the engine. The kinematic viscosities of the 20-hour segment samples are compared to the viscosity of the ten-minute sample to determine the viscosity increase of the test oil.

The GMOD is operated at the following test states during the 100-hour portion of the test:

| Parameter | Set Point |
|------------------------------|------------------|
| Engine Speed | 3000 r/min |
| Engine Load | 250 N-m |
| Oil Filter Block Temperature | 145 °C |
| Coolant Outlet Temperature | 115 °C |
| Fuel Pressure | 410 kPa |
| Intake Air Temperature | 35 °C |
| Intake Air Pressure | 0.05 kPa |
| Intake Air Humidity | 11.4 g/kg |
| Exhaust Back Pressure | 3 kPa |
| Engine Coolant Flow | 190 L/min |
| Coolant System Pressure | 123 kPa |
| Fuel Temperature | 35°C |
